# Noetherian rings with unusual prime ideal structures

Anya Michaelsen

Williams College

January 19, 2018

Introduction	Previous Results	Background	Construction
Background			

#### Remark

In this talk, a ring is a commutative ring with unity.

#### Definition

An **ideal** is an additively closed subset I of a ring R, such that for  $a \in I$ ,  $r \in R$ ,  $ra \in I$ . A **prime ideal** is a proper ideal P such that if  $rs \in P$ , then either  $r \in P$  or  $s \in P$ .

#### Definition

Given a ring R, the **spectrum** of a R, denoted Spec R, is the set of all its prime ideals.

Introd	uction	Previous Results	Background	Construction

	Question			
	Given a poset X (commutative) (	, when can $X$ ring $R$ ?	be realized as the spectrum of a	
	Example			
		X	$\operatorname{Spec} \mathbb{Q}[[x,y]]$	
		$egin{array}{c} M \   \ c \   \ (0) \end{array}$	$egin{array}{c} (x,y) \ & ert \ c \ & ert \ (0) \end{array}$	

Introduction	Previous Results	Background	Construction
Previous Results			

## Theorem (Hochster)

Provided necessary and sufficient conditions for when a poset is the spectrum of a ring.

#### Question

Given a poset X, when can X be realized as the spectrum of a (commutative) ring R with [property]?

#### Definition

A **Noetherian** ring is one in which every ideal is finitely generated.

Introduction	Previous Results	Background	Construction
Previous Res	ults		

#### Question

Does there exist a (nontrivial) uncountable Noetherian ring with a countable spectrum?

Ring	Uncountable?	Countable Spec?
$\mathbb{Q}[x,y]$	no	yes
$\mathbb{Q}[[x,y]]$	yes	no

## Theorem (Colbert, 2016)

There exists an *n*-dimensional uncountable Noetherian ring with countable spectrum for any  $n \ge 0$ .

# Regular local rings

#### Definition

A regular local ring (*RLR*) is a local ring, (R, M), such that M has a minimal set of generators  $M = (r_1, \ldots, r_n)$  where  $n = \dim R$ .

#### Definition

A ring R is **regular** if  $R_P$  is a RLR for every  $P \in \operatorname{Spec} R$ .

Examples: If k is a field

- k and  $k[x_1, \ldots, x_n]$  are regular rings
- k and  $k[[x_1, \ldots, x_n]]$  are RLRs

	τ	ro					

Background

# Background

# Definition

A Noetherian local ring  $(A, A \cap M)$  is **excellent** if

- For all  $P \in \operatorname{Spec} A$ ,  $\widehat{A} \otimes_A L$  is regular for every finite field extension L of  $A_P/PA_P$ .
- $\bigcirc$  A is universally catenary

#### Lemma

Given A with completion  $T = \mathbb{Q}[[x_1, \ldots, x_n]]$ , A is excellent if for each  $P \in \operatorname{Spec} A$  and  $Q \in \operatorname{Spec} T$  with  $Q \cap A = P$ ,  $(T/PT)_Q$  is a regular local ring (RLR).

Introduction	F Tevious Results	Background	Construction
Construction			
Given $n \geq 2$ ,			

```
\mathbb{Q}[x_1,\ldots,x_n] \subset B \subset \mathbb{Q}[[x_1,\ldots,x_n]] = T
         Spec \mathbb{Q}[x_1,\ldots,x_n]:
                   (x_1,\ldots,x_n)
                          N<sub>0</sub>
                          \aleph_0
                          (0)
```

# Construction

# Theorem (AM)

There exists an *n*-dimensional uncountable excellent regular local ring with a countable spectrum for any  $n \ge 0$ .

# O The Base Ring, S

- $\mathbb{Q}[x_1,\ldots,x_n] \subset S \subset \mathbb{Q}[[x_1,\ldots,x_n]] = T.$
- If  $s \in pT \in \operatorname{Spec} T$ , then  $pu \in S$  for some  $u \in T$ .
- S will be excellent, countable, with  $\widehat{S}=T$
- Oncountability
  - To S we will adjoin uncountably many units from T
  - Preserve the cardinality of the spectrum

Construction			

## Theorem (AM)

There exists an *n*-dimensional uncountable excellent regular local ring with a countable spectrum for any  $n \ge 0$ .

## Second Excellence

- Adjoin elements so that for  $b \in B$ ,  $bT \cap B = bB$ .

#### Lemma

Every finitely generated ideal of B is extended from S. Hence,  $IT \cap B = IB$  for finitely generated ideals.

#### Lemma

The ring B is Noetherian with completion T. Hence B is a RLR.

Construction			

Second Excellence

- Adjoin elements so that for  $b \in B$ ,  $bT \cap B = bB$ .

#### Lemmas

- Every finitely generated ideal of B is extended from S.
- $IT \cap B = IB$  for finitely generated ideals  $I \subseteq B$ .
- The ring B is Noetherian with completion T. Hence B is a RLR and has dimension n.

#### Theorem (AM)

There exists an *n*-dimensional uncountable excellent regular local ring with a countable spectrum for any  $n \ge 0$ .
